Patent No. 6472368
GENERAL INFORMATION:
APPLICANT: Doherty, Patrick
APPLICANT: Blaschuk, Orest W.
APPLICANT: Gour, Barbara J.
TITLE OF INVENTION: COMPOUNDS AND METHODS FOR MODULATING ADHESION MOLECULE
TITLE OF INVENTION: PUNCTION
FILE REFERENCE: 100006403C1
CURRENT APPLICATION NUMBER: US/09/351,048A

Claim 1; Page 15-17; 36pp; Japanese.

The present sequence represents human occludin, a novel adhesion molecule which is a constituent protein of membrane tight junctions. Antibodies raised against the protein are used to assay for occludin in samples, and for the study of occludin localisation in membranes (e.g. by immunofluorescent call-staining). The transformants and antibodies are used for screening of substances which potentially influence occludin expression. Therapeutic polynucleotides derived from the DNA encoding the present sequence are used for treatment of disorders involving the bloodbrain barrier. Primers that hybridise to the occludin DNA sequence can be used to detect occludin DNA by PCR

English

```
This protein comprises human occludin, an integral transmembrane protein specifically associated with tight junctions that functions in forming intercellular seals. Its amino acid sequence was deduced from overlapping cDNA clones (see AAT93752) obtained from a human liver cDNA library. Occludin can be used to reduce tissue permeability. Occludin inhibitors can be used to enhance delivery of drugs (or gene therapy vectors) by increasing absorption across endothelial or epithelial barriers, is transmucosal or transvacular drug delivery. Inhibitors include occludin surface loop peptides that inhibit adhesion and/or barrier properties, or antibodies that intercat with occludin coccludin receptors. Methods are claimed for identifying occludin inhibitors and for screening for the presence or absence of occludin inhibition in a sample
                                                                                       Isolated human occludin protein - useful for increasing drug delivery across endothelial or epithelial barriers, or for reducing tissue permeability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAB35731 standard; protein; 522 AA.

The method involves thuse of specific DNA markers. The method of the invention is useful in detection and treatment of ovarian and breast cancer. Amino acid sequences ABJ37025 - ABJ37080 represent human breast/ovarian cancer-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to a pharmaceutical composition used for gene therapy, comprising a nucleic acid encoding a therapeutic gene and a promoter, a transfection vehicle and an agent to disrupt the function of the junctional complex in the cells. The pharmaceutical composition has cytostatic, cardiant, vasotropic, antiinflammatory and antilipaemic activity. The pharmaceutical composition is useful for gene therapy and for enhancing efficiency of gene delivery to cells. The composition is useful for gene therapy of cystic fibrosis, inflammatory or fibroic lung diseases, peripheral vascular disease, coronary arterial diseases, restenosis, hypercholesterolaemia and cancer. The present sequence represents the human occludin protein. Occludin is used in the invention to determine the effect of the junctional inhibitors used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 212

The invention discloses a composition comprising two or more isolated rate or human polynuclectides or a polynuclectide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the movel polynuclectide, a host cell comprising the vector, a method for identifying a nuclectide sequence which is differentially regulated in an animal subjected to pain and a chart is differentially expressed in neuronal tissue of a first animal cubjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound which regulates the activity of one or more of the compound that regulates the activity of one or more of the composition, a compound that regulates the activity of one or more of the composition, a method for identifying a compound useful in treating compound to a method for identifying a compound useful in treating continity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating compulates its activity is useful for preparing a medicament for treating condulates its activity is useful for preparing a medicament for treating condulates its activity is useful for preparing a medicament for treating condulates its activity is useful for preparing a medicament for treating condulates its activity is useful for preparing a medicament for treating confinury (CCI) and spared nerve injury (SNI) in an animal (e.g. spane there specification) which is differentially expressed during pain.

Che specification, but was obtained in electronic form directly from WIPO at the wipo.int/pub/published_pot_equences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                152
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       452

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New diagnostic and therapeutic polynucleotides and polypeptides, useful in diagnosing a condition, disease or disorder associated with human molecules, e.g. autoimmune or inflammatory disorders, in gene therapy or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to a novel composition comprising a biologically active agent and mucosal delivery-enhancing effective amount of permeabilising peptide that reversibly enhances mucosal epithelial paracellular transport by modulating epithelial junctional structure and/or physiology in a mammal. The agent of the invention inhibits homotypic binding of epithelial membrane adhesive protein chosen junctional adhesion molecule (JAM), occludin and claudin. The biologically active agent is effective for treatment of sexual dysfunction. Che example male servetile sexual dysfunction or female sexual dysfunction. The present sequence is that of the human occludin protein which is related to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                YGTSLLGGSVGYPYGGSGFGSYGSGYGYGYGYGGYTDPRAAKGFMLAMAAFCFIAA

with human molecules, e.g. cell proliferative disorders, autoimmune/inflammatory disorder, developmental disorder, endocrine disorder, neurological disorder, developmental disorders, or infections caused by virus, bacteria, fungi or paradite. The dithp molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline gene therapy. The present sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          180

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 272 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnostic associated with human molecules, e.g. cell proliferative disorder, endocrine disorder, neurological disorders, davelopmental disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp concletus may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline gene therapy. The present sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm 61 YGTSLLGGSVGYPYGGSGFGSYGSGYGYGYGYGYGYGYTDPRAAKGFMLAMAAFCFIAA 213 YALCNOFYTPAATGLYVDOYLYHYCVVDPOEAIAIVLGFMIIVAFALIIFFAVKTRRKMD RYDKSNILWDKEHIYDEQPPNVEEWVKNVSAGTQDVPSPPSDYVERVDSPMAYSSNGKVN RYDKSNILMDKEHIYDEQPPNVEEWVKNVSAGTQDVPSPPSDYVERVDSPMAYSSNGKVN 1 MHVRPMLSQPAYSFYPEDEILHFYKWTSPPGVIRILSMLIIVMCIAIFACVASTLAWDRG 93 YGTSLLGGSVGYPYGGSGFGSYGSGYGYGYGYGYTDPRAAKGFMLAMAAFCFIAA YALCNOFYTPAATGLYVDQYLYHYCVVDPQEAIAIVLGFMIIVAFALIIFFAVKTRRKMD LVIFVTSVIRSEMSRTRRYYLSVIIVSAILGIMVFIATIVYIMGVNPTAQSSGSLYGSQI DB 8; 96.4%; Score 2498; DB 8; 96.9%; Pred. The present sequence is encoded by APT9973, which encodes an extra 16 amino acid residues in the correct reading frame, which are not shown in the specification. Antibodies raised against the protein are used to assay
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               - useful for screening for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents mouse occludin, a novel adhesion molecule which is a constituent protein of membrane tight junctions. Antibodies raised against the protein are used to assay for occludin in samples, and for the study of occludin localisation in membranes (e.g. by immunofluorescent cell-staining). The transformants and antibodies are used for screening of substances which potentially influence occludin present sequence are used for treatment of disorders involving the present sequence are used for treatment of disorders involving the blood-brain barrier. Primers that hybridise to the occludin DNA sequence can be used to detect occludin DNA by PCR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             YGTSLLGGSVGYPYGGSGFGSYGSGYGY-GYGYGYGYTDPRAAKGFMLAMAAFCFIA 119

for occludin in samples, and for the study of occludin localisation in membranes (e.g. by immunofluorescent cell-staining). The transformants and antibodies are used for screening of substances which potentially influence occludin expression. Therapeutic polynucleotides derived from the DNA encoding the present sequence are used for treatment of disorders involving the blood-brain barrier. Primers that hybridise to the occludin DNA sequence can be used to detect occludin DNA by PCR
                                                                                                                                                                                                                                                               120

comparison of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also comprising the vector comprising the nucleic acid sequence. Also comprising the vector comprising the nucleic acid sequence which is differentially regulated in an animal subjected to pain and a Kit to perform the method, an array, a method for identifying an agent that is differentially expression of the polymucleotide sequence which is differentially expression of a polymucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the polymucleotides, a method for identifying a paramaceutical composition, a method for identifying a compound that regulates the activity of one or more of the polymetication, a method for identifying a compound that regulates the activity in an animal of one or more of the polypeptides or their antibodies. The polymucleotide or the compound that composition comprising the one or more polymetication and a pharmaceutical composition comprising the one or more of the sequence presented is a rat protein (described in Table 3 or therapy). The sequence presented is a rat protein (described in Table 3 or the sequence data for this patent did not form part of the printed for the specification) which is differentially expressed during pain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                119

Antagonists of the polymeptides or nucleic acids that inhibit the expression of the protein, can be used to inhibit ELL2 activity in a patient. A method for diagnosing or determining a susceptibility to neoplastic disorders comprises assaying ELL2 gene expression level in mammalian cells or body fluid and comparing these expression levels with a standard, such that an increase or decrease in levels indicates an increased our decreased susceptibility. The gene expression level is assayed using the antibody, or by detecting ELL2 mRNA levels. The host cells of may be used to identify compounds which bind to an ELL2

polypeptide with biological activity. The polymucleotides and polypeptides are useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders and other traits, to assess biodiversity, as nutritional sources or supplements. The polymucleotides may also be used as molecular weight markers, chromosome markers or map related gene positions, or as an antigen to raise anti-DNA antibodies or elicit immune response. The polymeptides are useful for raising antibodies, as markers for tissues in which the corresponding polypeptide is expressed, for re-engineering damaged or diseased tissues, for treating myeloid or lymphoid cell disorders, in bone cartilage, tendon, ligament and/or nerve tissue growth or requencation, in wound healing, in tissue repair and replacement, in resent sequence represents the amino acid sequence of a novel human

cancer-associated nucleic acid molecules (No and proteins represent numeral color cancer-associated nucleic acid molecules (No and proteins are collectively known as colon cancer antigens have extostatic activity and can be used in gene therapy cancer antigens have extostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P carcinomas and cancers. Additional diagnosis and treatment of colorectal carcinomas and cancers. Additioation of the present invention. N.B. Pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027
